

## Energy analyzer for three-phase systems

### Description

Three-phase energy analyzer for DIN-rail mounting with configuration joystick, frontal selector and LCD display. Direct connection up to 65A or via current and voltage transformers. It can be equipped with 2 digital outputs (pulse transmission or alarm function). In alternative the Modbus RTU or Dupline communication port and 3 digital inputs, the M-Bus communication, or the Modbus TCP/IP Ethernet ports are available.

The wireless M-Bus version is the perfect solution when cabling is not possible.

### Benefits

- **Time saving set-up**, by frontal joystick and selector.
- **Error-proof installation**, by self-power supply and phase sequence detection.
- **Easy variable scrolling**, by means of the front joystick.
- **Wide interfacing capability**, choosing among 2 pulse outputs, the RS485, the M-Bus, Dupline or the Ethernet communication port.
- **Extended energy measurements**, using total/partial or total/multi-tariff metering.
- **Flexible installation**, by means of the direct connection up to 65 A or the connection of 5 A current transformers.
- **Extended alarm control** on any available variable by means of up to two digital outputs.
- **Legal metrology**, guaranteed by the MID approval
- **Wireless communication**, wireless M-Bus version allows remote data collection when cabling is not possible due to cost or installation requirements.
- **Easy commissioning** of wireless communication thanks to the test function of the joystick and to transmission counter for diagnostics.

### Applications

EM24 is the perfect solution in any application, specially in building and industrial automation where energy and main electrical variables monitoring is required.

EM24 is particularly suited for:

- energy efficiency monitoring
- cost allocation
- fiscal/legal sub-billing, where the wireless M-Bus version is the best choice for quick and easy installation without cables. Encryption ensures data security and safeguards confidentiality.

### Main functions

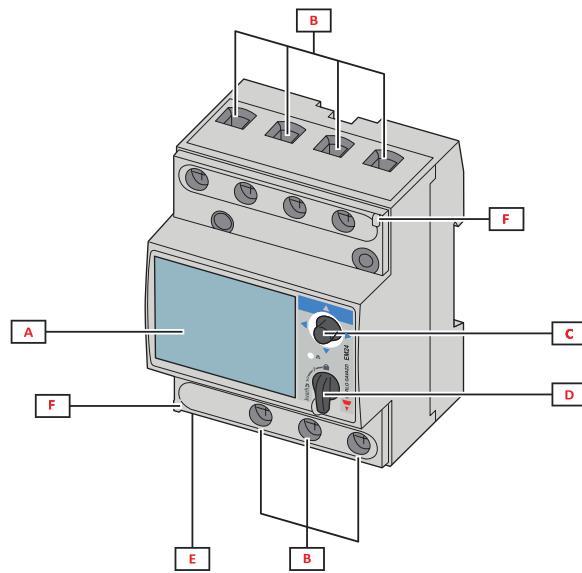

- Measurement of energy consumption and main electrical variables of single-phase, two-phase or three-phase loads.
- Display of single phase measurements and total measurements.
- Transmission of data via serial communication (Modbus RTU, M-Bus or Dupline) or Ethernet (Modbus TCP/IP).

- Transmission of energy consumption via pulse output (optional).
- Easy connection function.
- Transmission of data via wireless M-Bus (868 MHz for the European market).
- Two wireless M-Bus versions: a compact model with internal antenna and a SMA connector model with external antenna (in case of metallic switchboard).

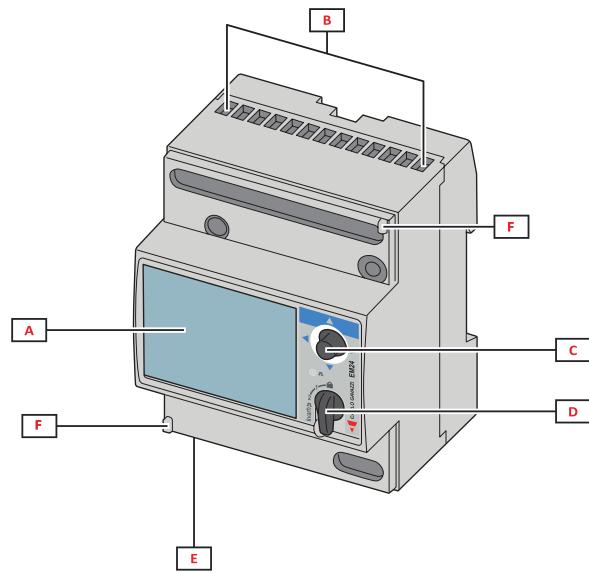

## Main features

- Energy measurements: total and partial kWh and kvarh or based on 4 different tariffs; single phase measurements
- Gas, cold water, hot water, kWh remote heating measurements via digital inputs
- TRMS measurements of distorted sine waves (voltages/currents)
- Data encryption (a unique key will be provided for any device in a sealed envelope included in the instrument box)

## ► Measurement mode

Depending on the APPLICATION setting, a different selection of variables is available on the display (see manual) and the energy calculation is worked out as follows:

- Standard: both kWh+ and kWh- are available;
- EC: easy connection function, the power is always integrated (both in case of positive and negative power).

In MID analyzers the calculation depends on the model:

- PFA: Easy connection, the total energy totalizer (kWh+) is certified according to MID;
- PFB: only the total positive totalizer (kWh+) is certified according to MID. The negative energy totalizer is available but not certified according to MID.

## ► Energy metering

For every measuring interval time, the energies of the single phases are summed; according to the sign of the result, the positive (kWh+) or negative totalizer (kWh-) is increased.

Example:

P L1= +2 kW, P L2= +2 kW, P L3= -3 kW

Integration time = 1 hour

$$+\text{kWh}=(+2+2-3)\times1\text{h}=(+1)\times1\text{h}=1\text{ kWh}$$

$$-\text{kWh}=0\text{ kWh}$$
